

Power Ranger Plugin for Cinema 4D

Welcome to the Power Ranger plugin! Designed with animators in mind, this unobtrusive dialogue smoothly integrates into your workflow, providing a powerful solution for rendering individual or ranges of frame images.

Features

ERROR CORRECTION AND SEAMLESS RE-RENDERING

Mistakes happen, but they don't have to slow you down. Easily correct errors in a small number of frames without the need to re-render the entire project.

SEARCH FOR AND RENDER MISSING FRAMES

Our plugin examines the output folder to identify missing frames and renders them all in one go.

Installation

Place the **power_ranger_plugin_vn.n** folder into the **Cinema 4D Preferences > plugins** folder accessible by opening **Edit > Preferences** window in Cinema 4D and clicking **Open Preferences Folder** button at the bottom of the window.

Please note, it will not work if you place the plugin in the plugins folder within the Cinema 4D application folder, it must be in Preferences > plugins.

Usage

Open the plugin by going to Extensions > Power Ranger in Cinema 4D

Enter the desired frames or frame ranges in the input box. Specify ranges with a dash '-' and separate ranges and single frames with a comma.

Pressing the 'Fill Missing Frames' button will look for missing frames in a rendered image sequence in the render 'Save' path folder specified in the selected render settings.

An efficient way to use Power Ranger is to delete all the problematic frames in your rendered sequence and press 'Fill Missing Frames' to quickly re-render all the deleted frames.

Press Render to set off all the specified frames.
